Video games are pretty awesome

What do you do in video games  
that you don't do in real life?

# Players as Ethical Agents

- You never just play a game
- You bring your background, your life experiences, your culture, your interests, your education, and many other aspects into playing games
- Some games have lots of things you can make obvious decisions about doing
- Some games don't do this but still bring these aspects into play
- Players respond to morally relevant gameplay
- Games can have significant effects on players too

# What morally relevant games should do (Sicart)

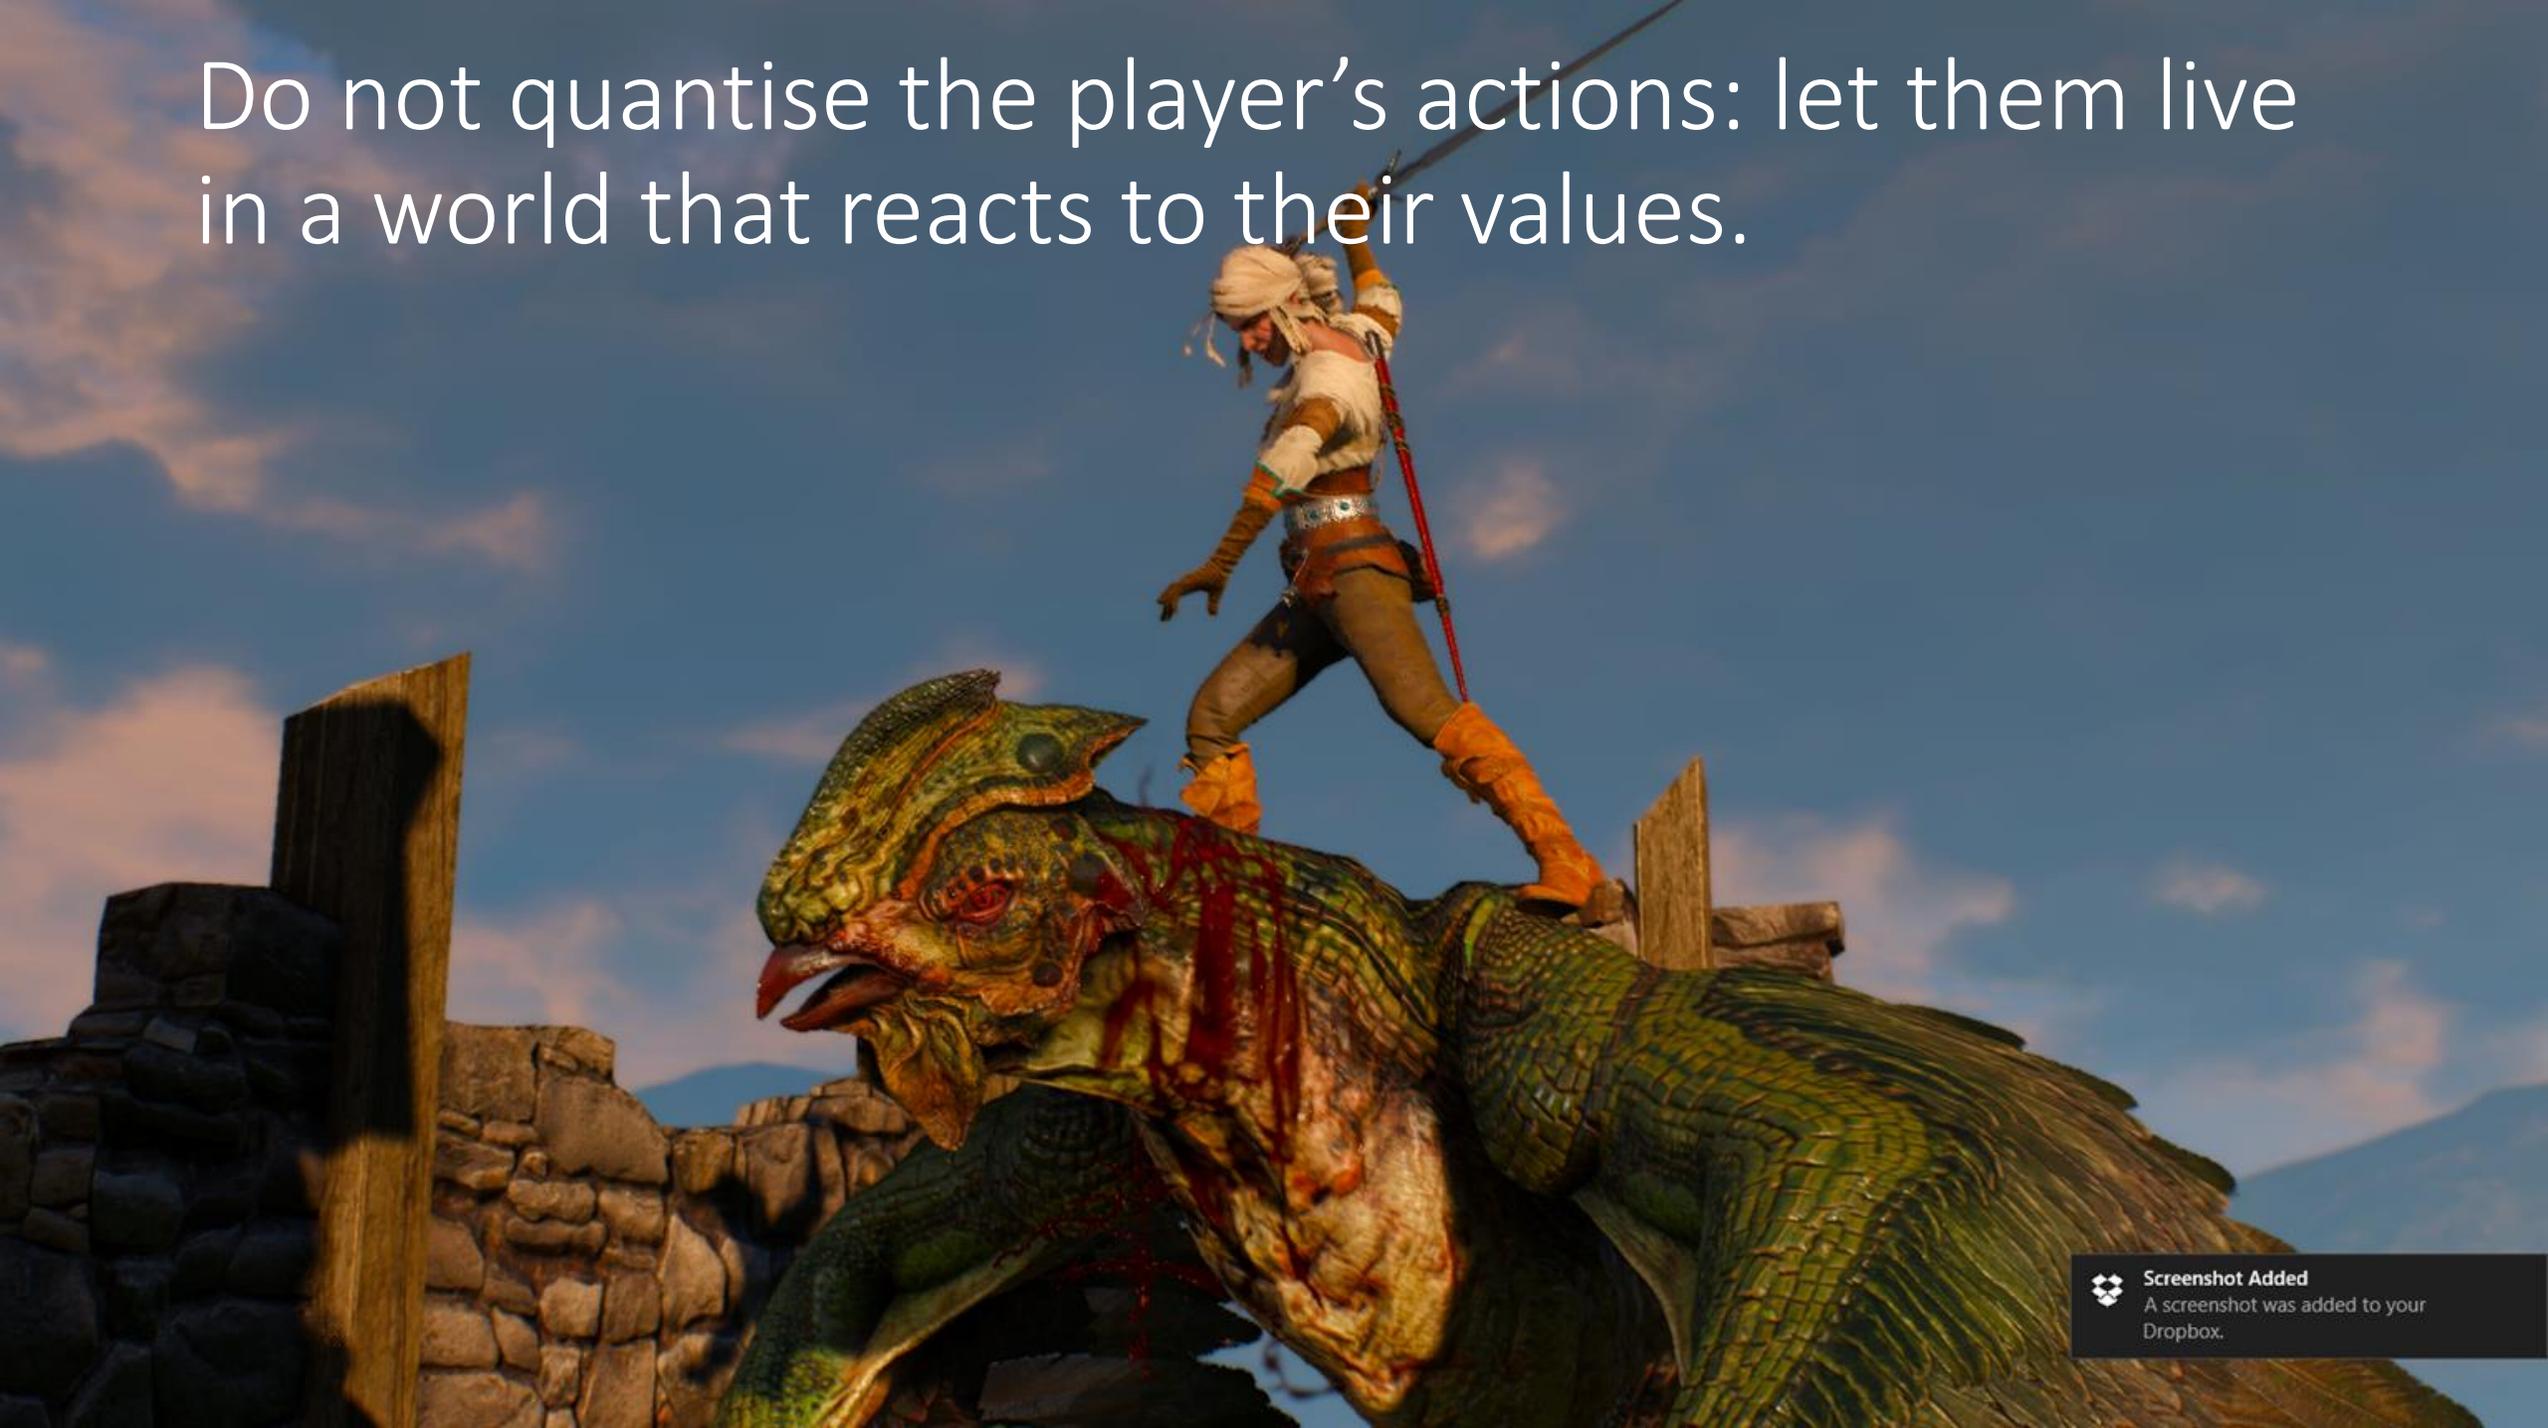

- Create an ethically relevant game world.
- Do not quantise the player's actions: let them live in a world that reacts to their values.
- Exploit the tension of being an ethical player.
- Insert other agents with constructivist capacities and possibilities.
- Challenge the poietic\* capacities of players, by expanding or constraining them.

\*poietic: productive/formative

Create an ethically relevant game world

Do not quantise the player's actions: let them live in a world that reacts to their values.

A screenshot was added to your  
Dropbox.

Exploit the tension of being an ethical agent

Legion: "Does this unit have a soul?"

Upload the code.

We're letting the geth die.

Challenge the poietic capacities of players...

...by expanding or constraining them

# In summary... (according to Sicart)

- Some of the best games are games with ethical decisions/ethical reflective capability in them
- Developers shouldn't give players numbers and bars to help them aim for things, let the world naturally respond to their choices
- They should make players make tough decisions (that have ethical dimensions/consequences)
- They should let players work out their own ethics in games (multiplayer-type games) in a responsible social manner
- For extra credit, they should make games that make players question their in game decisions by constraining or expanding the players' perspectives

# But people respond to games that don't do this too

- My (forthcoming) qualitative studies into gamers' emotional connections with games show huge influence of:
  - Characters and character development
  - Narrative/story
  - Music
  - Social aspects unrelated to rules
  - "Being there for them in down times"
- So don't despair if your game doesn't follow Sicart's "rules" – moral gameplay is not the only way to engage players
  - But if you claim to allow players moral choice you should probably take a look

# Some other video game research I do

- Advise on ethics for 3D-Tune-In (gamification of hearing aid tuning/education about hearing loss)
- PAX East outreach
- Representations of chickens in games
- Pokémon Go and perceptions of mental health
- Pokémon Go and automation
- Ethics advisor to the No Man's Sky Archaeological Survey
- PhD students:
  - researching women's representation and experiences in games
  - VR for children with disabilities
